

Considered Settings

- Fuzzy or neural model of the process available
(many of the presented techniques apply to other types of models as well)
- Based on the model, design a controller (off line)
- Use the model explicitly within a controller
- Model fixed or adaptive

Outline

- ① Local design using Takagi–Sugeno models
- ② Inverse model control
- ③ Model-based predictive control
- ④ Feedback linearization
- ⑤ Adaptive control

TS Model \rightarrow TS Controller

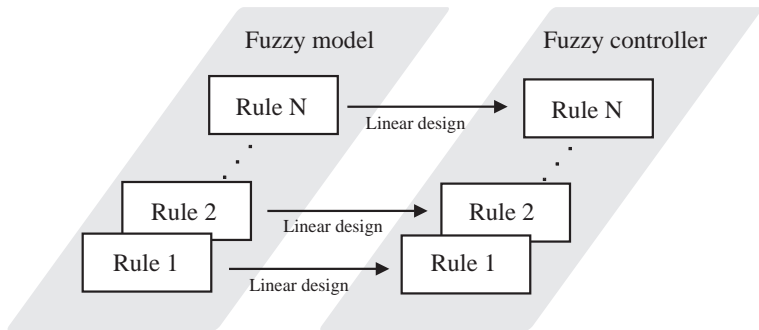

Model:

- If** $y(k)$ is Small **then** $x(k + 1) = a_s x(k) + b_s u(k)$
If $y(k)$ is Medium **then** $x(k + 1) = a_m x(k) + b_m u(k)$
If $y(k)$ is Large **then** $x(k + 1) = a_l x(k) + b_l u(k)$

Controller:

- If** $y(k)$ is Small **then** $u(k) = -L_s x(k)$
If $y(k)$ is Medium **then** $u(k) = -L_m x(k)$
If $y(k)$ is Large **then** $u(k) = -L_l x(k)$

Design Using a Takagi–Sugeno Model

Apply classical synthesis and analysis methods locally.

Control Design via Lyapunov Method

Model:

$$\text{If } \mathbf{x}(k) \text{ is } \Omega_i \quad \text{then} \quad \mathbf{x}_i(k+1) = \mathbf{A}_i \mathbf{x}(k) + \mathbf{B}_i \mathbf{u}(k)$$

Controller:

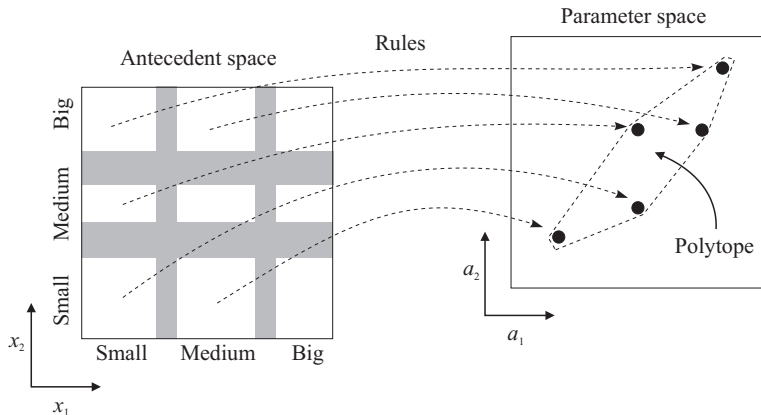

$$\text{If } \mathbf{x}(k) \text{ is } \Omega_i \quad \text{then} \quad \mathbf{u}_i(k) = -\mathbf{L}_i \mathbf{x}(k)$$

Stability guaranteed if $\exists \mathbf{P} > \mathbf{0}$ such that:

$$(\mathbf{A}_i - \mathbf{B}_i \mathbf{L}_j)^T \mathbf{P} (\mathbf{A}_i - \mathbf{B}_i \mathbf{L}_j) - \mathbf{P} < \mathbf{0}, \quad i, j = 1, \dots, K$$

TS Model is a Polytopic System

$$\mathbf{x}(k+1) = \left(\sum_{i=1}^K \sum_{j=1}^K \gamma_i(\mathbf{x}) \gamma_j(\mathbf{x}) (\mathbf{A}_i - \mathbf{B}_i \mathbf{L}_j) \right) \mathbf{x}(k)$$

Inverse Control (Feedforward)

Process model: $y(k+1) = f(\mathbf{x}(k), u(k))$, where

$$\mathbf{x}(k) = [y(k), \dots, y(k - n_y + 1), u(k - 1), \dots, u(k - n_u + 1)]^T$$

Controller: $u(k) = f^{-1}(\mathbf{x}(k), r(k+1))$

When is Inverse-Model Control Applicable?

- ① Process (model) is stable and invertible
- ② The inverse model is stable
- ③ Process model is accurate (enough)
- ④ Little influence of disturbances
- ⑤ In combination with feedback techniques

How to invert $f(\cdot)$?

- 1 Numerically (general solution, but slow):

$$J(u(k)) = \left[r(k+1) - f(\mathbf{x}(k), u(k)) \right]^2$$

minimize w.r.t. $u(k)$

How to invert $f(\cdot)$?

- 1 Numerically (general solution, but slow):

$$J(u(k)) = \left[r(k+1) - f(\mathbf{x}(k), u(k)) \right]^2$$

minimize w.r.t. $u(k)$

- 2 Analytically (for some special forms of $f(\cdot)$ only):
 - affine in $u(k)$
 - singleton fuzzy model

How to invert $f(\cdot)$?

- 1 Numerically (general solution, but slow):

$$J(u(k)) = \left[r(k+1) - f(\mathbf{x}(k), u(k)) \right]^2$$

minimize w.r.t. $u(k)$

- 2 Analytically (for some special forms of $f(\cdot)$ only):
 - affine in $u(k)$
 - singleton fuzzy model
- 3 Construct inverse model directly from data

Inverse of an Affine Model

affine model:

$$y(k+1) = g(\mathbf{x}(k)) + h(\mathbf{x}(k)) \cdot u(k)$$

express $u(k)$:

$$u(k) = \frac{y(k+1) - g(\mathbf{x}(k))}{h(\mathbf{x}(k))}$$

substitute $r(k+1)$ for $y(k+1)$

necessary condition $h(\mathbf{x}) \neq 0$ for all \mathbf{x} of interest

Example: Affine Neural Network

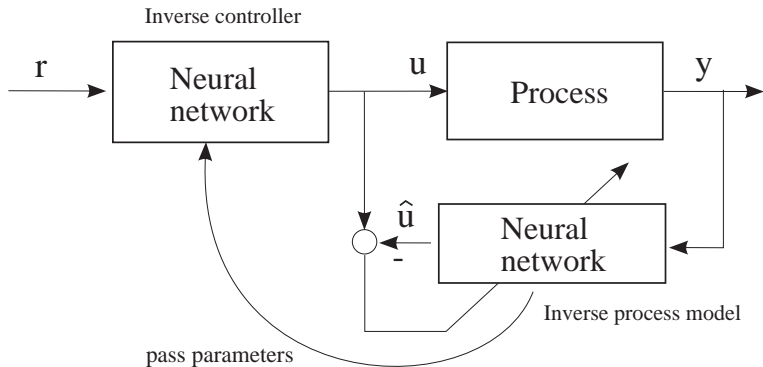

Example: Affine TS Fuzzy Model

\mathcal{R}_i : **If** $y(k)$ **is** A_{i1} **and** \dots **and** $y(k - n_y + 1)$ **is** A_{in_y} **and**
 $u(k - 1)$ **is** B_{i2} **and** \dots **and** $u(k - n_u + 1)$ **is** B_{in_u} **then**

$$y_i(k+1) = \sum_{j=1}^{n_y} a_{ij}y(k-j+1) + \sum_{j=1}^{n_u} b_{ij}u(k-j+1) + c_i,$$

$$y(k+1) = \sum_{i=1}^K \gamma_i(\mathbf{x}(k)) \left[\sum_{j=1}^{n_y} a_{ij}y(k-j+1) + \sum_{j=2}^{n_u} b_{ij}u(k-j+1) + c_i \right] \\ + \sum_{i=1}^K \gamma_i(\mathbf{x}(k)) b_{i1}u(k)$$

Learning Inverse (Neural) Model

How to obtain \mathbf{x} ?

inverse model: $u(k) = f^{-1}(\mathbf{x}(k), r(k+1))$

- 1 Use the prediction model: $\hat{y}(k+1) = f(\hat{\mathbf{x}}(k), u(k))$

$$\hat{\mathbf{x}}(k) = [\hat{y}(k), \dots, \hat{y}(k - n_y + 1), u(k-1), \dots, u(k - n_u + 1)]^T$$

Open-loop feedforward control

How to obtain \mathbf{x} ?

inverse model: $u(k) = f^{-1}(\mathbf{x}(k), r(k+1))$

- 1 Use the prediction model: $\hat{y}(k+1) = f(\hat{\mathbf{x}}(k), u(k))$

$$\hat{\mathbf{x}}(k) = [\hat{y}(k), \dots, \hat{y}(k - n_y + 1), u(k-1), \dots, u(k - n_u + 1)]^T$$

Open-loop feedforward control

- 2 Use measured process output

$$\mathbf{x}(k) = [y(k), \dots, y(k - n_y + 1), u(k-1), \dots, u(k - n_u + 1)]^T$$

Open-loop feedback control

Open-Loop Feedforward Control

- Always stable (for stable processes)
- No way to compensate for disturbances

Open-Loop Feedback Control

- Can to some degree compensate disturbances
- Can become unstable

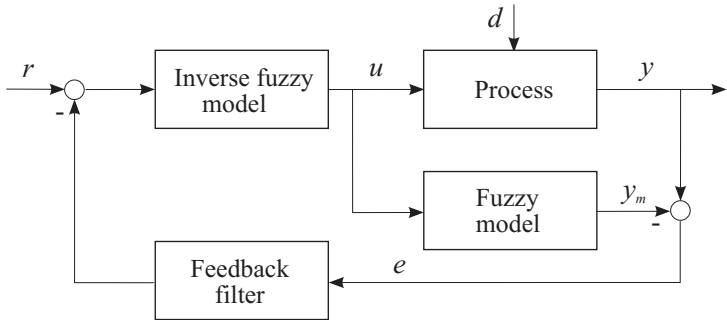

Example: Computed Torque Control¹

- Open-loop feedforward control + low gain PD controller
- Video: RBD model vs. learned model
- Video: adaptive model

Internal Model Control

Model-Based Predictive Control

Model-Based Predictive Control

Objective Function and Constraints

$$J = \sum_{i=1}^{H_p} \|\mathbf{r}(k+i) - \hat{\mathbf{y}}(k+i)\|_{P_i}^2 + \sum_{i=1}^{H_c} \|\mathbf{u}(k+i-1)\|_{Q_i}^2$$

$$\hat{\mathbf{y}}(k+1) = f(\hat{\mathbf{x}}(k), \mathbf{u}(k))$$

$$\begin{array}{ccccc} \mathbf{u}^{\min} & \leq & \mathbf{u} & \leq & \mathbf{u}^{\max} \\ \Delta \mathbf{u}^{\min} & \leq & \Delta \mathbf{u} & \leq & \Delta \mathbf{u}^{\max} \\ \mathbf{y}^{\min} & \leq & \mathbf{y} & \leq & \mathbf{y}^{\max} \\ \Delta \mathbf{y}^{\min} & \leq & \Delta \mathbf{y} & \leq & \Delta \mathbf{y}^{\max} \end{array}$$

Feedback linearization

=

Feedback Linearization (continued)

given affine system: $y(k + 1) = g(\mathbf{x}(k)) + h(\mathbf{x}(k)) \cdot u(k)$

express $u(k)$:

$$u(k) = \frac{y(k + 1) - g(\mathbf{x}(k))}{h(\mathbf{x}(k))}$$

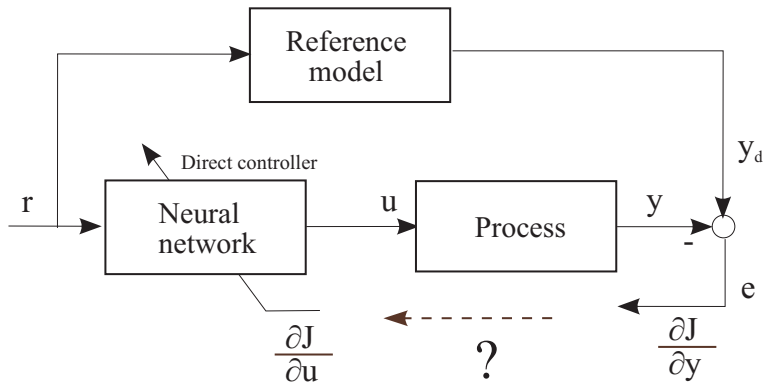

substitute $A(q)y(k) + B(q)v(k)$ for $y(k + 1)$:

$$u(k) = \frac{A(q)y(k) + B(q)v(k) - g(\mathbf{x}(k))}{h(\mathbf{x}(k))}$$

Adaptive Control

- Model-based techniques (use explicit process model):
 - model reference control through backpropagation
 - indirect adaptive control
- Model-free techniques (no explicit model used)
 - reinforcement learning

Model Reference Adaptive Neurocontrol

Model Reference Adaptive Neurocontrol

Indirect Adaptive Control

not only for fuzzy models, but also for affine NNs, etc.

Reinforcement Learning

- Inspired by principles of human and animal learning.
- No explicit model of the process used.
- No detailed feedback, only reward (or punishment).
- A control strategy can be learnt from scratch.
